Factors that affect accuracy would involve using incorrect amounts, incorrect procedures, impure substances, or anything that doesn't follow the correct procedure. Factors that affect precision would involve changes made from one trial to another.

Accordingly, the "true value" of a target behavior is what the practitioner has observed the client doing. The practitioner's task, then, is to formulate a description of the target behavior so that interveners will respond only to those client behaviors the practitioner has observed and considered important.

Accuracy, Error, Precision, and Uncertainty. It is a measure of how well a measurement can be made without reference to a theoretical or true value. The number of divisions on the scale of the measuring device generally affects the consistency of repeated measurements and, therefore, the precision.

The purpose of this document is to provide the facts about the accuracy of self-monitoring of blood glucose (SMBG) systems. Accuracy can be defined as the closeness of agreement of a test result with an accepted reference value. There are multiple drivers of accuracy, including manufacturing processes, environmental factors and patient use.

## **Complexity, Accuracy, and Fluency as Properties of**

Accuracy and Precision: Accuracy refers to the closeness of a measured value to a standard or known value. For example, if in lab you obtain a weight measurement of 3.2 kg for a given substance, but the actual or known weight is 10 kg, then your measurement is not accurate. In this case, your measurement is not close to the known value.
