The most common processing approach in the time or space domain is enhancement of the input signal through a method called filtering. Digital filtering generally consists of some linear transformation of a number of surrounding samples around the current sample of the input or output signal. There are various ways to characterize filters; for example:

The Scientist and Engineer's Guide to Digital Signal

I've been reading this book to refresh my memory on digital signal processing. It is a good book, lots of theory in there, however it is a bit dry in its explanations, there are a lot of results (for example the value of a certain number series) that just are presented out of the blue while the reader scratches his head trying to come up with the missing steps.

Other recursive filter programs: rffr.c - Calculates the frequency response of a recursive filter using the coefficient file created by one of the above programs. rdf.c - Filters data from an input file, using a coefficient file generated by one of the above programs.. FIR Nonrecursive Digital Filters. A general nonrecursive filter is implemented as follows:
