1 Quantification of Secrecy in Partially Observed

To define probability distributions for the simplest cases, one needs to distinguish between discrete and continuous random variables. In the discrete case, it is sufficient to specify a probability mass function assigning a probability to each possible outcome: for example, when throwing a fair dice, each of the six values 1 to 6 has the probability $1/6$.

The simplest control systems are based around small discrete controllers with a single control loop each. These are usually panel mounted which allows direct viewing of the front panel and provides means of manual intervention by the operator, either to manually control the process or to change control setpoints.

$\hat{y} = a + bx$ is the equation of the LSRL where $b = \text{slope} = r \left(\frac{s_y}{s_x} \right)$ and the point (\bar{x}, \bar{y}) is always on the line. Do not extrapolate (predict a y value when the x value is far from the other x values).. 3. Coefficient of Determination (r^2) gives the proportion (%) of variation in the values of y that can be explained by the regression line.
