Cancer epigenetics is the study of epigenetic modifications to the DNA of cancer cells that do not involve a change in the nucleotide sequence. Epigenetic alterations may be just as important, or even more important, than genetic mutations in a cell's transformation to cancer. In cancers, loss of expression of genes occurs about 10 times more frequently by transcription silencing (caused by ...

Transgenerational epigenetic inheritance is the transmission of information from one generation of an organism to the next (i.e., parentâ€“child transmission) that affects the traits of offspring without alteration of the primary structure of DNA (i.e., the sequence of nucleotides) â€“in other words, epigenetically. The less precise term "epigenetic inheritance" may be used to describe both ...

Researchers are intensifying efforts to understand the mechanisms by which changes in metabolic states influence differentiation programs. An emerging objective is to define how fluctuations in metabolites influence the epigenetic states that contribute to differentiation programs. This is because metabolites such as S-adenosylmethionine, acetyl-CoA, Î±-ketoglutarate, 2-hydroxyglutarate, and ...
