Hydraulic fracturing (also fracking, fraccing, frac'ing, hydrofracturing or hydrofracking) is a well stimulation technique in which rock is fractured by a pressurized liquid. The process involves the high-pressure injection of 'fracking fluid' (primarily water, containing sand or other proppants suspended with the aid of thickening agents) into a wellbore to create cracks in the deep-rock ...

Fracture patterns can be mapped from the exposure of rock outcrops or man-made excavations (e.g. borehole, quarry, tunnel and roadcut). These geologically-mapped fracture networks were widely used to understand the process of fracture formation , , interpret the history of tectonic stresses , , and derive the statistics and scaling of fracture populations , , .
